ABSTRACT

The 1969-70 report on California's testing program provides information on the achievement scores of students in grades one, two, three, six, and twelve. The report is divided into three parts: (1) a statewide analysis and summary--an introduction to the report which begins with a summary of the findings; (2) percentile ranks and normalized standard scores for achievement test scores and other school district factors for all districts--the data collected from the program and a district-by-district analysis of test scores and other factors; and (3) prediction of achievement test scores for each California school district--a technical addition designed to assist school personnel and others in analyzing the data obtained from the program; relationships among test scores and district input factors and differences between actual scores and predicted scores for each school district are examined. A list of school districts and tables of regression weights for predicting are appended. (Author/KM)

California State Testing Program 1969-70

A District by District Analysis of Test Scores and Other School Factors

Prepared by the
OFFICE OF PROGRAM EVALUATION

This publication, which was funded under provisions of Title V of the Elementary and Secondary Education Act, was edited and prepared for photo-offset production by the Bureau of Publications, California State Department of Education, and was published by the Department, 721 Capitol Mall, Sacramento, CA 95814.

Printed by the Office of State Printing
1972

Foreword

Interest in and concern for the testing process as an evaluation tool are part of the historical records
California public education. Ezra S. Carr, seventh superintendent of public instruction, had the same concer
for testing in 1878 as I have today. Dr. Carr expressed those concerns in his annual report to the Governor.
essence he believed that the system of testing which we employ must be used to help the youth in our schoo
and to provide a source of improved instruction for each child.

The manner in which we test, the types of results we get, and the way in which we are able to analyze tho
results must be part of a comprehensive continuing evaluation system that is diagnostic as well as comparati
and that accounts for process as well as for product. A one-score test evaluation, regardless of the amount
subject matter it covers, is not sufficient to provide the information we need to improve instruction for th
individual student.

The present statewide testing program was mandated by legislation passed in 1961 and first put into effe
during the 1962-63 school year. The report of the results of the testing program that year contained a word
caution that is worth repeating in this report of the 1969-70 test results. Each school district should judge i
performance in relation to other school variables. When the test results in a statewide testing program are use
primarily to compare communities within the state and schools within the communities, the attention given th
results can be misused.

I am concerned that we conduct the state testing program in the most effective and efficient manner possib
and that we use the results of the program to improve the education of our children. A task force has bee
appointed to study the state testing program and to make recommendations for its improvement. I enlist you
help in this important effort.

Wilson Riles

Superintendent of Public Instruction

Preface

This 1969-70 report on California's mandated testing program contains information on the achievement scores of students in grades one, two, three, six, and twelve. This is the second such report that has been prepared, and we believe that the contents of this report will provide useful information to school districts for evaluating their instructional programs.

The format this year has been changed extensively over that used in last year's report, and we believe the use of a common scale for all factors will be helpful in making meaningful analyses of the data.

In addition to changing the format of the report, we have also presented for the first time analyses of scores obtained from the *Cooperative Primary Reading Test*, which was adopted by the California State Board of Education in 1969.

The report is divided into three parts: I, A Statewide Analysis and Summary; II, Percentile Ranks and Normalized Standard Scores for Achievement Test Scores and Other School District Factors for All Districts; and III, Prediction of Achievement Test Scores for Each California School District. Part I serves as an introduction to the whole report, and it begins with a summary of the findings. Part II presents the data collected from the 1969-70 testing program and a district-by-district analyses of the test scores and other factors. Part III is a technical addition to the report, which was designed to assist school personnel and others in analyzing the data secured from the 1969-70 California state testing program.

Summary of the Report on California's State Testing Program in 1969-70

This report presents the findings of a study of California's state testing program in 1969-70. The factors examined in the study were divided into two groups for the analyses: (1) the 15 indicators of school quality in terms of the products of the educational system, referred to as output factors; e.g., pupil scores on achievement tests; and (2) the 18 indicators of school quality in terms of the characteristics of school districts, referred to as input factors; e.g., assessed valuation, class size, tax rates, and teachers' salaries. Complete descriptions of these factors are given in the first part of this report.

For purposes of analysis, the factors are presented according to the types of school districts maintaining educational programs in California: unified, elementary, and high school. A comparison of data from the three types of school districts showed that, in comparison with statewide averages: (1) unified districts tend to have larger enrollments, higher teacher salaries, larger classes, higher tax rates, higher expenditures per pupil, and greater proportions of nonteaching certificated personnel than the averages; (2) elementary districts have smaller enrollments, lower teacher salaries, lower tax rates, lower expenditures per pupil, lower proportions of nonteaching certificated personnel, and higher assessed valuations per pupil than the statewide averages; and (3) high school districts tend to have higher teacher salaries, higher assessed valuations per pupil, and greater expenditures per pupil than the statewide averages.

For purposes of the study, the three types of districts were divided into several size groups on the basis of regular average daily attendance. Generally, it was found that the larger districts of each type had higher pupil test scores, higher teacher salaries, higher tax rates, larger average class sizes, lower assessed valuations per pupil, lower levels of family poverty, and less staff turnover than the smaller districts had.

Part II of this report presents the statewide testing data for 1969-70 for each school district in California. This part makes it possible to compare the data for each school district with that of all other districts or with a set of districts of similar type and size.

The analyses described in Part III of the report allow the reader to compare the test performances of pupils in each school district with a set of "expected" scores which were predicted on the basis of selected input characteristics of the district. An analysis of the overall relationships among the factors examined showed that high pupil achievement test scores were most related to high pupil scholastic ability scores and low rates of family poverty. High achievement scores were also associated with high teachers' salaries, larger districts, high expenditures per pupil, high proportions of nonteaching certificated personnel, low percentages of minority group pupils, low rates of pupil mobility, low rates of staff turnover, small class sizes, and low pupil-teacher ratios.

Based on these relationships, equations were developed which were used to obtain predicted test scores for each school district. The degree to which the actual scores of each district exceeded or fell short of the predicted scores is presented in the tables of Part III. Several precautions are discussed to help the reader use the information properly and to avoid reaching incorrect and possibly misleading conclusions.

California State Testing Program, 1969-70

PART I

A Statewide Analysis

Introduction to the Report on the Statewide Testing Program

The objectives of California's statewide testing program are outlined in Education Code Section 12821, as follows:

> (a) To afford a means and procedure for evaluating the effectiveness of the public schools as shown by the competence and progress of public school pupils in basic skills and content courses.
>
> (b) To make such evaluations available to educational agencies and the public as a basis for the correction of deficiencies in, and the improvement of, all phases of the state educational system and as a basis for research.
>
> (c) To afford to the Legislature facts from which it may determine the proper allocation and expenditure of public funds for public school education.

The reader will note that certain aspects of these objectives relate to the functions and operations of the state and that other aspects pertain more directly to the operations of school districts. In both cases the role of the testing program is to provide information about the quality of instruction and the level of learning in California public schools. Such information should be helpful to policymakers and administrators at both local and state levels in their efforts to make the public school programs more effective. The basic purpose of this report is to supply some of that necessary information.

Previous reports have presented information about the general levels of progress of California pupils in learning the basic academic skills. This report provides more detailed and diagnostic information on the skills and knowledge of pupils in each school district. Average test scores are presented by grade levels and instructional areas.

Structure of the Report

The first part of this report provides a narrative and statistical description of the factors examined in California's statewide testing program in 1969-70.

The second and third parts of the report provide data on the relative performance of pupils in each district. The data are presented and analyzed in a number of ways. Each presentation is designed to shed light on this question: "How well are the pupils in each district doing?" This question implies that it is possible to compare the performance of pupils in each school district with some absolute criteria which yield precise descriptions of quality. However, such absolute standards for describing pupil performance in each school district have not yet been developed. In lieu of such standards, tentative indications of the quality of the educational program in each school district may be gained by comparing data from each district with data from other districts in the state.

In Part II of this report, data from each school district are compared with data from all other districts and with a subset of districts of similar size and type of organization.

Part III of this report presents an analysis of the relationships between academic achievement test scores (output factors) and a variety of social, financial, and instructional characteristics of the school districts (input factors). This will provide the reader with basic data regarding school achievement and the processes and problems of managing the schools to obtain maximum pupil achievement. The performances of pupils in each district are compared to a set of "expected" scores, which are predicted on the basis of the input characteristics of the district; e.g., tax rates, teachers' salaries, and assessed valuation. The development and validity of these prediction equations are also discussed in Part III.

Limitations of This Report

The chief limitation of this report is that it presents and analyzes pupil achievement only as indicated by scores on standardized achievement tests. The tests are usually designed to measure some relatively stable pupil characteristics; e.g., reading ability and computational skills.

Frequently, public schools are criticized for not being able to show proof of their effectiveness. Although the results from standardized achievement tests should not be the only criteria used for determining whether certain school programs are effective, test results can be valuable in making such determinations. The goals of education are complex, and standardized tests measure only a few of those goals. However, a good standardized achievement test does reflect the objectives stressed in many schools.

Evaluation of a program implies more than measurement Evaluation implies looking at the measurement in the light of objectives and costs and making decisions about the value of the outcomes obtained. Tests are valid for some uses but not necessarily for others. Nevertheless, they are useful measures of the intellectual growth of pupils to the extent that they represent common objectives among the schools.

Descriptions of Factors Examined in the Study

The school district factors examined in this study have been placed in two discrete groups: the products of the educational system and the characteristics of the school districts. The first group describes the products of the educational system; i.e., the skills and competencies of the pupils after some period of instruction, as measured by the achievement tests adopted for use in 1969-70 by the State Board of Education. These factors are the median achievement test scores for each school district. The achievement tests were administered to all pupils in grades one, two, three, six, and twelve during the 1969-70 school year. These test score factors are alternately referred to as output, outcome, or criterion factors, because they indicate the quality of the output or outcome of instruction in terms of pupil learnings which in turn serve as the criteria by which the schools are evaluated.

The second group of factors describe each school district in terms of its financial characteristics, community characteristics, instructional program, and pupil characteristics. Most of the data for the factors were collected by the Department of Education in the routine conducting of its duties. Some examples of these factors are tax rate, assessed valuation per pupil, class size, and teachers' salaries. These factors are also referred to as "input" factors in this study, since they indicate the quality and magnitude of the input or resources which each school district is willing and able to bring to bear upon its educational problems. Later in the report they are referred to as "predictor" variables, since the factors are used to predict or estimate the median test scores for each school district.

The term "variable" is often used interchangeably with "factor." Either term applies to an item of information about a school district – either a median test score or one of the other characteristics of school districts.

Description of Achievement Tests Used in State Testing Program – Outcome Factors

The following descriptions apply to the achievement tests administered to all pupils in grades one, two, three, six, and twelve during the 1969-70 school year. Each of the tests were published by major companies and are used in various school districts throughout the country. It would be necessary to inspect carefully each test to understand fully the types of skills being assessed. However, the brief descriptions which follow give a general indication of the skills required for success on each test.

The Test for Grade One

The Cooperative Primary Reading Test, Form 12A, which was selected for grade one, surveys the pupil's understanding of the basic concepts he needs for developing reading skills. It tests his ability to comprehend as well as his skill to remember and to make comparisons. Each of the 50 items on the test requires the pupil to read a word, sentence, or paragraph and then mark a response from among three choices. Of the 50 sets of potential responses, 20 are presented in pictorial form, with the remaining 30 sets composed of words or sentences and paragraphs expressing concrete and abstract concepts. The vocabulary of the test is geared to standard primary reading programs and most instructional materials.

Tests for Grades Two and Three

The *Stanford Reading Test,* Primary II, Form W, was selected for use in grade two, and the *Stanford Reading Test,* Primary II, Form X, was selected for grade three. These tests are each composed of two subtests: word meaning and paragraph meaning. Only the pupil's total reading score, which is computed by taking the sum of the correct responses on each of the subtests, is reported to the State Department of Education.

Word meaning subtest. This subtest consists of 36 multiple-choice items, graduated in difficulty, which measure the pupil's ability to read a sentence and to select a correct word to complete the sentence.

Paragraph meaning subtest. This subtest consists of a series of paragraphs, graduated in difficulty; in each paragraph one or two words have been omitted. The pupil's task with each of the 60 questions is to demonstrate his comprehension of the paragraph by selecting the proper word from four choices that are afforded him. The test thus provides a measure of the pupil's ability to comprehend. The test ranges in difficulty from single sentences to paragraphs of several sentences, and it involves levels of comprehension varying from extremely simple recognition to the making of inferences from several related sentences. The paragraphs were designed to be of interest to young children, and a vocabulary level has been used which tests a child's comprehension of related discourse rather than simply his word knowledge. The test is based on the concept of "reading as reasoning" and, consequently, places a premium on genuine comprehension ability rather than on the mechanical skills of reading.

Reading Progress Scores for Grades Two and Three

Two additional test score factors are included in the analysis for each district with pupils in grades two and three. The first factor is the median grade equivalent score for second and third grade pupils, which is calculated when they were at the end of grade one. The second is the median of the differences between pupil grade equivalents at the end of the first grade and the grade equivalents earned at the end of the second or the third grade. The first figure is referred to as a base; the second, as the gain or number of months of progress achieved since establishing that base. It is essential to relate the gain to the base, because pupils with a lower base tend to make less gain than pupils with higher baseline scores.

The Tests for Grade Six

The *Comprehensive Tests of Basic Skills,* Form Q, Level 2, was selected for use in grade six. Eight subtests of this battery have been adopted for use in the state testing program. All items in the various subtests are of the multiple-choice type, with either four or five choices for each item.

Reading (subtests 1, vocabulary; and 2, comprehension). The Reading Vocabulary Subtest consists of 40 items which test the pupil's understanding of the meaning of underlined words presented in short statements. The pupil chooses, from among four alternatives, the word which has the closest meaning to the underlined word.

The Reading Comprehension Subtest consists of 45 items designed to measure the pupil's ability to recognize stated details; to comprehend the ideas presented; to interpret by identifying main ideas, perceiving relationships, drawing conclusions, and making inferences; and to extend interpretations beyond the statements provided. The test uses articles, stories, poems, and letters as the bases for the test items.

A total reading score is obtained by adding the number of correct responses gained on each subtest. Only the total score is reported to the State Department of Education.

Language (subtests 3, language mechanics; 4, language expression; and 5, spelling). The Language Mechanics Subtest consists of 25 items designed to measure the pupil's ability to punctuate and capitalize. Ability to punctuate is tested by having the pupil decide whether punctuation marks are needed within a letter and an article on school activities. Capitalization is measured in two stories in which each sentence is divided into four parts. The pupil indicates which sentence part, if any, has a capitalization error.

The Language Expression Subtest presents 30 items related to short sentences, stories, and a poem in which words or phrases are omitted. The pupil indicates which words or phrases among the alternatives available he would select to "fit best" the form and sense of the statement. The Spelling Subtest consists of 30 items, each presenting four words. The pupil indicates which, if any, of the alternatives are spelled incorrectly.

A total language score is obtained by adding the number of correct responses gained on each subtest. The total score is reported to the State Department of Education and, in addition, the scores of the Spelling Subtest are reported separately.

Arithmetic (subtests 6, arithmetic computation; 7, arithmetic concepts; and 8, arithmetic applications). The Arithmetic Computation Subtest presents 48 items equally distributed among the four fundamental mathematical processes of addition, subtraction, multiplication, and division. They involve whole numbers, fractions, decimal fractions, and mixed numbers. The items are arranged to test each pupil in each process, regardless of his speed of performance.

The Arithmetic Concepts Subtest consists of 30 items which measure the pupil's ability to recognize and/or apply appropriate concepts and techniques in order to demonstrate his comprehension of various numerical concepts and interrelationships. These items go beyond the four fundamental processes and explore concepts involved in measurement (money, time, length, volume, temperature), algebra, geometry, statistics, and logic.

The Arithmetic Applications Subtest presents 20 items in which the emphasis is on problem-solving. Word problems are presented to test the pupil's ability to comprehend the problem, to select an appropriate method for solving the problem, to reorganize the available facts, and to solve the problem by arriving at a correct answer. The responses available to the pupil may not require him to solve the problem but may only ask him to indicate how he would solve it.

A total arithmetic computation score is obtained by adding the total number of correct responses gained on all three of these subtests.

The Tests for Grade Twelve

The *Iowa Tests of Educational Development,* Form X-4, Class Period Version, was selected for the statewide testing program in grade twelve in 1969-70. Three of the tests from this battery have been adopted for use in the state testing program.

Language and Spelling (test 3, correctness and appropriateness of expression). This test explores the pupil's mastery of some of the basic skills needed for effective writing: punctuation, usage, capitalization, spelling, dictation, phraseology, and organization. The 70 items in the first part of the test present a letter and three short passages which might have been written by a high school student. The student's task is to determine if underlined words or sections are correct or if they should be replaced by one of three available alternatives. The examples present errors and inappropriate expressions, and the student is required to demonstrate his abilities rather than to state formal rules and principles.

The second part of this test presents 60 words in 15 questions representing the most common types of spelling problems or errors. Scores are reported to the State Department of Education for the total test and for the spelling section separately.

Arithmetic (test 4, ability to do quantitative thinking). This test presents 33 practical problem situations which most would agree high school graduates should be able to solve. Because of its concern with practical problems, the test has implications for the guidance of pupils regarding several curricular areas, particularly in the natural sciences and the social sciences. However, it also offers a measure of general aptitude for the study of mathematics. It covers basic computational skills involving whole numbers, fractions, and decimals; the pupil's ability to apply those skills in problem-solving situations involving such concerns as volume, area, measurements, proportions, formulas, roots and powers, cost and profits, and approximations; and it involves the interpretation of linear interpolations, symbols, graphs, tables, and charts.

Reading (test 5, ability to interpret reading materials in the social studies). This test assesses the student's ability to interpret and evaluate reading matter representative of textbooks, reference books, periodical articles, and newspaper items dealing with social problems and social studies in general. The student is not merely asked to assimilate the ideas presented, but he is also asked to comprehend the implications and interrelationships of the ideas and to evaluate the authors' approaches and handling of the topics.

Eight passages dealing with geography, sociology, comtemporary social problems, economics, political science, and history are presented. They are loosely organized, with the most important thoughts often implied rather than stated explicitly. The 53 questions which accompany these passages frequently require the student to make qualitative, subjective judgments.

Description of School District Characteristics Examined in Study of State Testing Program – Input Factors

In order to interpret properly the results of achievement tests, it is necessary to consider the ability and the willingness of school districts to provide for a quality educational program. It is also essential to consider the strengths and weaknesses of the pupils in the district in terms of their abilities to profit from the instructional programs offered. Descriptions of each of the district and pupil characteristic (input) factors used in this study are presented in the paragraphs that follow.

Minimum and Maximum Salaries Paid to Teachers

Data on the minimum and maximum salaries paid to teachers in 1969-70 were derived from information collected from each school district by the Bureau of Administrative Research and District Organization, California State Department of Education (Form R-1). This form requests data based on a frequency distribution of salaries actually paid to teachers, with a lower interval of under $6,000 and a top interval of $15,000 and over. Each interval has a range of $300. The median salary was calculated for each school district based on this distribution. For school districts that operated community (junior) colleges, only data on salaries paid to teachers of kindergarten through grade twelve were included in this report.

Average Class Size, Grades One Through Three

Information on average class size in grades one through three is collected annually by the Bureau of School Apportionments and Reports, California State Department of Education (Form J-7). The average number of pupils per class is rounded to one decimal place. School districts with less than 101 units of average daily attendance (a.d.a.) were not required to complete Form J-7.

Pupil-Teacher Ratio, Grades Four Through Eight

Information on pupil-teacher ratio in grades four through eight is also collected annually by the Bureau of School Apportionments and Reports (Form J-7). The average number of pupils enrolled per full-time equivalent classroom teacher in each school district was computed to one decimal place. Districts with less than 101 units of average daily attendance were not required to complete Form J-7.

Certificated Nonteaching Personnel

The number of certificated nonteaching personnel per 100 full-time equivalent teachers was taken from data collected for the report produced by the Bureau of Administrative Research and District Organization entitled *Ratios of California Public School Nonteaching Employees to Classroom Teachers as of November 1, 1969 and 1970.* Data for the publication are taken from Form R-2, "Annual School District Employee Ratio Report." The total number of pupil services and administrative employees was divided by the total number of full-time equivalent teachers to obtain the proper ratio. The ratio was computed to one decimal place.

Information on certificated nonteaching personnel was not collected from elementary school districts with less than 101 units of a.d.a. or from high school districts with less than 301 units of a.d.a. Administrators of common administration districts were asked to supply two ratios for this report, one for grades one through eight and one for grades nine through twelve.

Total General Fund Tax Rate

The total general fund tax rate was taken from information collected on Form J-29B from each school district and summarized by the Bureau of Administrative Research and District Organization. It is the sum of the general purpose tax rate and the permissive override tax rates. The following special tax rates for capital outlay and other special purposes have been omitted from this calculation: annual repayment of state loans, Public School Building Loan Fund, bond interest and principal payment, Children's Center Fund, Development Center for Handicapped Minors Fund, and annual charge for use of property.

Total General Purpose Tax Rate

The total general purpose tax rate was taken from information collected from each school district on Form J-29B and summarized by the Bureau of Administrative Research and District Organization. It includes the areawide tax when levied. In the few cases in which a school district reported permissive override tax rates but was not levying a general purpose tax at the legal tax rate limit, the permissive override tax rates were considered part of the general purpose tax rate to the extent of the legal tax rate limit.

Assessed Valuation per Unit of Average Daily Attendance

To compute the assessed valuation per unit of a.d.a., the 1969-70 modified assessed valuation for each school district was divided by the 1969-70 total regular a.d.a. in grades one through twelve. This factor was calculated to the nearest dollar. The regular a.d.a. was used in the calculation, because it is a figure that is derived from sources common to all school districts. The total a.d.a. was not used because of the wide variation among districts in the operation of summer schools, continuation schools, and adult classes.

Percent of Minority Enrollment

In this report the percent that the minority enrollment is of the total enrollment of the school district is identified as "percent of minority enrollment." This information is collected annually by the Division of Compensatory Education, California State Department of Education, on Form OS/CR, "School Report of Racial and Ethnic Distribution of Pupils." The percents for the 1969-70 school year were computed to one decimal place.

Index of Family Poverty

The index of family poverty was derived by dividing the figure for the total funds which a school district was entitled to receive under Title I of the Elementary and Secondary Education Act of 1965 (Public Law 89-10) by the average daily attendance figure (less adults) of the district. The index of family poverty, as calculated from the ESEA, Title I, entitlement rather than from expenditures, had the advantage of not being affected by districts that (1) did not submit ESEA, Title I, projects; (2) submitted projects for less than their entitlement; or (3) spent less than the amount approved on a project. It provided a computational basis for determining poverty conditions of a school district without being influenced by the actions of the district.

Scholastic Ability

The median IQ scores were based on the *Lorge-Thorndike Intelligence Tests – Verbal Battery,* which was administered to pupils in grades six and twelve during October and November, 1969. This test, published by Houghton Mifflin Company, yields IQs ranging from 50 to 151 for grade six (Form 1, Level D) and from 50 to 150 for grade twelve (Form 1, Level G). The median IQ score computed to one decimal place was used as the measure of average scholastic ability for the pupils in each school district.

These tests were designed to measure abstract intelligence defined as "the ability to work with ideas and the relationships among ideas."

The verbal battery consists of five subtests:

1. The items in the vocabulary subtest require the examinee to choose from five words the one that has most nearly the same meaning as the given word (stem).
2. The sentence completion subtest requires the examinee to choose the one word out of five that best completes a sentence.
3. The arithmetic reasoning test presents short story problems. The examinee is to choose the correct answer from five alternatives, one of which is always "none of these."
4. The verbal classification items present a series of three words, and the examinee is to choose the one of five additional words that belongs with the original series.
5. The verbal analogy subtest is composed of items that present three words. The first two words are related to each other in some way, and the examinee is to choose which one of five answers is related to the third word in the same way.

Pupil Mobility

The pupil mobility (transitory) factors were derived by dividing the average daily attendance of the school district by the total annual enrollment of the district. Two transitory factors were computed for all school districts. The factors were based upon the regular day class a.d.a. and total annual enrollment for the two grade-level groups: one through eight and nine through twelve. These data are collected on the annual report of attendance forms: J-18A, for elementary grades; J-19EA, grades seven and eight; and J-19A, grades nine through twelve. The transitory factor for each grade-level group is the result of dividing the a.d.a. by the total enrollment. The total annual enrollment was defined as the count of pupils entered on the roll for regular classes during the course of the 1969-70 school year. Since pupils changing schools within a district were counted each time they enrolled in a different school, the factor includes intradistrict mobility as well as interdistrict mobility.

Rate of Staff Turnover

For purposes of this report, "staff" was restricted to "teachers," as defined in Education Code Section 321:

> (b) "Teacher" means an employee of a school district, employed in a position requiring certification qualifications and whose duties require him to provide direct instruction to pupils in the schools of that district for the full time for which he is employed. "Teacher" shall include, but not be limited to, teachers of special classes, teachers of exceptional children,

Statistical Description of the Population

The statistics for all factors used in this report of the California tate testing program, 1969-70, for all types of school districts are resented in Table 1. The data in this table present a yardstick by vhich the differences among the three types of school districts nay be observed: unified, high school, and elementary.

The mean values for each factor (variable) for each of the three ypes of districts are shown in Table 2. If data are not given for a particular variable, that means that the variable is not applicable to given type of district. For example, the grade twelve reading nean score would not apply to an elementary district. The (+) or –) indicates the direction of deviation of a particular variable from the statewide mean. This table clearly shows that unified chool districts consistently have means above the statewide verage (in many cases significantly above); however, the means for elementary school districts consistently fall below the statewide means. High school districts' means tend to rise above as often as they fall below the statewide means. It can be stated enerally that, among the three types of districts, differences in he area of pupil achievement and ability were slight compared to lifferences in monetary variables, such as tax rates, expenditures, nd salaries.

Another phase of the district analysis involved stratifying each f the three types of districts by units of a.d.a. and calculating neans for all variables within each a.d.a. group. The results for nified, elementary, and high school districts can be seen, espectively, in tables 3, 4, and 5. For example, if a person were interested in the effect of district size on median teacher salaries in unified districts, he would refer to Table 3, find median teacher salaries in the list of variables, then read directly across the five columns (each column representing a larger district) to observe any trend. In the example selected, he would find a general linear relationship; i.e., the larger the unified district, the higher the median teacher salary.

Table 6 was constructed to enable the reader to discern the relationship of all variable means to district size at a quick glance. For example, the grade twelve spelling means for high school districts increase as district a.d.a increases, so in Table 6 the word "up" has been placed in the appropriate place in the high school districts' column.

Several patterns are clearly evident in Table 6. First, there is a remarkable tendency for linear relationships to appear among many of the 33 variables. That is, as district a.d.a. increases, the means consistently increase or decrease. Second, when these linear relationships do occur, the overwhelming pattern is for variable means to increase with increasing district size. Two exceptions were Assessed Valuation/ADA (variable 24 in Table 6) and Rate of Staff Turnover (variable 31), which both decreased with increased district a.d.a. Finally, in unified districts and elementary districts, there was a surprising tendency for consistent linear trends to be "disrupted" by the means of the largest districts. In those cases, which were relatively frequent, once district size reached a certain level, further increases in a.d.a. produced less effect on the mean of the variable under examination.

TABLE 1

Statistical Description of All California School Districts in Terms of Scores Obtained from California State Testing Program and Other School Factors, 1969-70

Variable	Number of Districts	Mean	Standard Deviation	Minimum Value	Maximum Value
Achievement Test Scores					
1. Grade 1 Reading	909	22.31	5.70	3.00	46.50

California State Testing Program, 1969-70

PART II

Percentile Ranks and Normalized Standard Scores for Achievement Test Scores and Other School District Factors for All Districts

Introduction to Part II of the Report on California's State Testing Program, 1969-70

The purpose of Part II of this report on California's state testing program for 1969-70 is to provide each school district in California with the data it needs to compare itself with other school districts in terms of median achievement test scores and various other district characteristics. It is possible, with the information provided by this part of the report, for each district to compare itself both with all other school districts in California and also with a subset of districts, similar in type of organization and number of pupils.

Information for two school districts is presented on each page of Table 7. Districts are arranged alphabetically by county. On the left side of each page, 15 test score factors (output) are listed first; then 18 district characteristic factors (input) are listed. The definitions for each of these factors, which are also referred to as variables, are presented in Part I of the report. All input and output data, ranks, and graphic representations of the ranks for each district are listed in five columns under each district name. The five columns are described in the following paragraphs:

- *Factor value.* This is the actual "raw" numerical value for each input and output factor for each district. For the test score factor (variables), the factor value is the median (midpoint) test score for all pupils in the district at that grade level. For the other factors it is the number of dollars, ratio, percentage, or whatever descriptive form is used to identify the data. Whenever the number of pupils in the district was less than 100, a footnote was printed urging the reader to use caution in interpreting the scores. This is important because test score medians based upon a small number of pupils are less reliable and more likely to fluctuate from year to year or from grade to grade than those for large numbers of pupils.
- *Group rank.*[1] In this column c

an those for large numbers of pupils.

- *Group rank.*[1] In this column of the table, the data for each district are compared with those of districts of similar size and organization. The group number, included in the heading for the third column on the table, identifies the school district by its type of organization and regular a.d.a., as follows:

Group	*Unified districts a.d.a.*	Group	*Elementary districts a.d.a.*	Group	*High school districts a.d.a.*
11	under 1,000	21	under 100	31	under 600
12	1,000 – 3,999	22	100 – 499	32	600 – 1,999
13	4,000 – 9,999	23	500 – 999	33	2,000 – 6,999
14	10,000 – 24,999	24	1,000 – 1,999	34	7,000+
15	25,000+	25	2,000 – 3,999		
		26	4,000 – 9,999		
		27	10,000+		

All districts are listed by group number in Appendix A.

- *State rank.*[1] Values under this column heading are also percentile ranks which indicate how a district compares with all other districts in California which have data for that factor. Since data on some factors were not collected from all districts, the number of districts involved in the comparison can be determined by consulting Table 1 in Part I of this report.
- *'Z' score (normalized).* One of the limitations of percentile ranks is that of unequal intervals. That is to say, the differences between any two sets of ranks is not equal in terms of the actual value of the factor being considered. For example, for the "median teacher salary" factor, the

---

[1] The values placed in the columns headed "Group rank" and "State rank" are percentile ranks. These percentile ranks indicate the percentage of school districts which had a factor value below a certain point. For example, if district A has a percentile rank of 42 on "Maximum Teacher Salary," it means that 42 percent of all districts within the given group had maximum salaries below that of district A. Percentile ranks range from 1 through 99. The scores for each factor were arranged so that districts with high scores or great quantities of a given factor received high ranks (near 99), and districts with low factor values received low percentile ranks (near 1). The meaning of high and low ranks for all factors is indicated in Chart 1.

(Note: The percentile ranks listed for the test score factors are *not* equivalent to those normally used by school districts in reporting test results.) The percentile ranks used in this report are based upon distributions of school district averages (medians), whereas, the raw score to percentile rank conversion tables that are
annually distributed by the State Departm

ing of high and low ranks

ctual dollars between a district scoring
rank and one scoring at the 55th
han the difference between a district
with a 90th percentile rank and one with a percentile rank of 95. This is because most factors are fairly normally distributed, which means, among other things, that the values for each factor tend to congregate around some central value. To make it possible for districts to make comparisons without this bias, the state percentile ranks for each factor for all districts were converted into normalized Z scores. These scores range from –2.3 to +2.3. An average score (percentile rank of 50) equals a Z score of 0.0. These scores do have the property of equal intervals, so that the difference, for example, between Z scores of +.6 and +1.0 is equal to the difference between +1.0 and +1.4.

- *Deviations from state mean.* Because the Z scores are visually complicated with (–) signs and decimals, they are graphically plotted in the column headed "deviations from state mean." Since the Z scores are normally distributed, they can be compared to a normal or "bell-shaped curve," which is shown in the heading of the column. Each Z score is plotted in terms of distance from the mean, as measured by standard deviations. A Z score of –1.0 is one standard deviation below the state mean; a Z score of +1.0 is one standard deviation above; and so forth. Xs have been printed to indicate how many standard deviation units each Z score falls above or below the state mean. Vertical lines indicate the standard deviation points. Each standard deviation is three Xs wide, so the accuracy of any given Z is plotted to within one-third of a standard deviation.

ol districts in reporting test results.) The percentile
ased upon distributions of school district averages
ore to percentile rank conversion tables that are
annually distributed by the State Department of Education are based upon frequency distributions of individual pupil scores. For any given raw score, this technical difference may result in vast differences between the two kinds of percentile ranks. For low median scores, the ranks listed in this report are much lower, and for high scores, they are much higher. In interpreting these ranks properly, therefore, it is important to remember that they are percentile ranks of district averages. For example, a percentile rank of 85 for a given district would mean that the average for that district exceeded the averages of 85 percent of the other districts. It would be inaccurate and misleading to say that the district average exceeded the performance of 85 percent of all *pupils.* Both methods of computing percentile ranks are equally valid. It was essential that the method based on averages be used in this report so that the percentile ranks for the test score variables are equivalent in meaning and, therefore, comparable to the ranks for the other factors.

California State Testing Program, 1969-70

PART III

Technical Supplement

Prediction of Achievement Test Scores for Each California School District

Important: This part of the report contains the results of an initial attempt to evaluate test scores for all school districts in the light of other information about the districts. The object of this effort was to provide information to school districts so that they could compare their test performance with that of other truly similar districts. Relatively new and complex statistical procedures were employed to accomplish this. These procedures can be employed in a variety of ways, each of which would yield slightly different results. The results of only one application of these procedures are presented here. Future issues of this publication will present the results of other methods of analyzing the test data, methods which hopefully will lead to even more accurate and unbiased estimates of the performance of school districts.

The findings presented here, therefore, must be considered *tentative* and *exploratory*. The reader is urged to consider carefully the precautions discussed and to restrict any interpretations accordingly. Comments regarding the technical procedures used or suggestions for improving the general usefulness of this part of the report are cordially invited.

elationships Among Test Scores and District Input Factors

One of the major purposes of this study of California's state ting program for 1969-70 was to begin to untangle and lineate the nature of the complex relationships between output riables (test scores) and input variables (district characteristics). e analyses described here represent only the beginning of the lineation. However, it is important to begin the work because alyzing the relationships involves the setting of "expectancies" school districts, which in turn become standards or criteria for luation. Furthermore, it would be helpful for policymakers to able to estimate the effects of their decisions, especially those cisions which result in the allocation of resources for one type educational improvement versus an allocation for another; e.g., nies for establishing smaller class sizes versus monies for hiring ditional teacher aides.

The analyses presented in this part of the report uncover ationships which may be the basic components in the eventual lding of a science or system which is capable of supplying the ormation needed to answer the critical questions about the ality of the educational system and to identify the most ective steps that must be taken to improve the system.

The use of the statistical techniques of correlational analyses l multiple regression analyses allow one to see the relationships among the output (test score) factors; (2) among the input tors; and (3) between the output and input factors; i.e., which ut factors are associated with high or low test scores. The ural by-products of these analyses are the estimated or dicted test scores for each district. The next section of this part the report shows how the discrepancies between the actual res and the predicted scores for each district can be properly lerstood and interpreted.

Results of Correlation Analyses of Factors Examined in Study of California State Testing Program

In this study correlation coefficients were computed separately for all variables for unified, elementary, and high school districts. A correlation coefficient is a measure of the relationship between two variables (or factors). This statistic can assume values ranging from −1.0 through zero to +1.0. Using two hypothetical sets of test scores to illustrate the meaning of this coefficient, a coefficient of +1.0 signifies that the person who had the highest score on one test also had the highest score on the other, and so on, exactly in parallel through the whole group. This illustration shows that if two variables are positively related and one increases, the other also tends to increase. Intelligence test scores are positively related to academic grades. In general, if the test scores are high, the grades received in school will also be high.

Other variables are inversely related; i.e., as one increases, the other decreases. This is indicated by a negative coefficient (−1.0). Think for a moment of the relationship between the speed of an automobile and the number of miles obtained per gallon of gasoline. The faster one drives, the lower the gasoline mileage will be. A zero coefficient on the other hand represents a complete lack of relationship.

As a rule of thumb, the magnitude of a correlation coefficient, whether positive or negative, can be interpreted as follows: .0 – .2, insignificant; .3 – .4, low; .5 – .6, moderate; .7 – .8, substantial; and .9+, high.

Results of Correlation Analysis for Unified School Districts

Tables 8, 9, and 10 present intercorrelation matrices for all variables for California's unified school districts. The tables provide for an easy examination of the relationships among the 15 test (output) variables (Table 8), the 18 predictor (input) variables (Table 9), and the relationships between the test variables and the predictor variables (Table 10).

By examining Table 8, one can see that the median test scores are highly intercorrelated. The coefficients range from .24 to .90, with many falling in the .70s and .80s. This is not unexpected since districts tend to be fairly consistent across grade levels and curricular areas. Factors affecting pupil achievement in one grade level or curricular area seem to have about the same amount of impact in other areas as well.

The coefficients presented in Table 9 for the independent or predictor variables range from –.70 through 0.0 to +.84. Most of the high positive coefficients are accounted for by variables which one would expect to be highly related; e.g., general fund tax rate and general purpose tax rate, class size and pupil-teacher ratio, median salaries and maximum salaries, and corresponding measures of pupil ability levels and pupil mobility rates for different grade levels. Other moderately high positive relationships were found between: percent minority enrollment and index of family poverty; proportion of nonteaching certificated employees and maximum salary; expenditures for instruction and assessed valuation per pupil; size of district and maximum salary; and size of district and general fund tax rate. These relationships were all positive, indicating a tendency for high values in one variable to be associated with high values in the other variable, low values with low values, and so forth.

The highest negative or inverse relationships were found between the measures of scholastic ability for grades six and twelve and the social-financial variables of percent minority enrollment and index of family poverty. Other negative values appeared between assessed valuation and the variables of a.d.a., class size, pupil-teacher ratio, and tax rate. Expenditures for instruction per pupil were negatively correlated with average class size and pupil-teacher ratio.

Table 10 presents coefficients of correlation between the 15 dependent variables (factors) and the 18 predictor variables. Looking first at the predictor variables, which are most highly related to test scores, and then examining those variables which are least related, it can be seen that scholastic ability scores are very closely related to achievement test scores. The coefficients range from .38 to .92, with many falling in the .70s and .80s.

ictor variables, which are most highly
then examining those variables which
seen that scholastic ability scores are
nievement test scores. The coefficients
many falling in the .70s and .80s.

One could think of several reasons to account for these high relationships. First, it is only logical to expect pupils with higher abilities to do better on achievement tests than pupils with lower scholastic abilities. The coefficients, although naturally high, may be slightly inflated due to other factors. The scholastic ability tests and the achievement tests are quite similar in many ways. They not only are alike in format and design, which in itself adds to the high coefficients, but the test content in terms of the skills and concepts which the tests measure are also quite similar. Without going into a lengthy discussion of the nature of scholastic ability tests, suffice it to say that no scholastic ability tests are culture-free. All tests use the concepts and experiences common to a culture to assess the degree to which a pupil is able to profit from schooling. This means that a child with an educationally and experientially rich background is likely to score well on ability tests as well as on achievement tests. It also means that a child with a poorer background, especially if he has a different language background, is likely to do poorly on both ability tests and achievement tests for the same reason. These are some spurious factors which contribute to the high relationships between scholastic ability variables and scholastic test variables.

The next highest coefficients are negative ones. Percent of minority enrollment and index of family poverty are inversely related to school achievement. The coefficients range in the −.50s and −.60s and go as high as −.73.

Other variables which correlated positively with achievement were teacher salaries, size of district, expenditures for instruction, and ratio of nonteaching certificated personnel to full-time equivalent teachers. The last two factors bear very low relationships with achievement.

Other variables which were negatively related to achievement were pupil mobility, rate of staff turnover, class size, and pupil-teacher ratio. Tax rates and assessed valuation per pupil were unrelated to school achievement.

Results of Correlation Analysis for Elementary School Districts

Tables 11, 12, and 13 present the intercorrelation matrices for elementary school districts. Relationships among the test variables are presented in Table 11. Relationships are all positive and generally moderate; however, they are possibly lower than those found for unified school districts.

Relationships among predictor variables, as presented in Table 12, were so similar to those found for unified districts that they will not be rediscussed here. The positive relationship between tax rate and teachers' salaries is slightly higher for elementary districts, and the negative relationship between family poverty and teachers' salaries is considerably stronger for elementary districts.

The relationships between the test variables and the predictor variables, as shown on Table 13, are so similar to those for unified districts that it is unnecessary to describe them. The positive relationship between nonteaching certificated personnel and the achievement test scores is somewhat lower for elementary districts, as are the negative coefficients between class size and school achievement and between pupil-teacher ratio and school achievement.

Results of Correlation Analysis for High School Districts

Tables 14, 15, and 16 present the intercorrelation matrices for high school districts. As displayed on Table 14, the relationships among the four test variables are all quite substantial. The coefficients for the predictor variables are presented on Table 15. The pattern of relationships is very similar to that observed for the unified and elementary districts. Slight differences in degree of relationship appear between certain variables; i.e., the positive relationship between expenditures for instruction and teachers' salaries is lower for high school districts than for unified or elementary districts.

The pattern of relationships between the test variables and the predictor variables is nearly identical to that observed for other districts with one exception: For elementary and unified school districts, a low positive relationship was found between test scores and nonteaching certificated personnel; however, for high school districts the relationship is low and negative.

Summary of Correlation Analyses

Not all correlation coefficients which
cance have been mentioned in this brief
moderate to high range have been discu
mentioned are summarized as follows:

Districts which had:	
High achievement scores in some curricular areas or grade levels	High a area
A high percentage of minority group pupils	High ra
A high proportion of nonteaching certificated employees	High m
Many pupils in the district	High r and
High scholastic ability test scores	Low pe pupi pove
High expenditures for instruction per pupil	Small pupi asses
High assessed valuation per pupil	Small pupi rates distr
High achievement test scores	High sc high pupi expe of n sonn mino of fa pupil turno sizes,

Summary of Correlation Analyses

Not all correlation coefficients which exceed statistical significance have been mentioned in this brief review; only those in the moderate to high range have been discussed. Those which were mentioned are summarized as follows:

Districts which had:	*Were likely to have:*
High achievement scores in some curricular areas or grade levels	High achievement scores in other areas and grade levels
A high percentage of minority group pupils	High rates of family poverty
A high proportion of nonteaching certificated employees	High maximum teachers' salaries
Many pupils in the district	High maximum teachers' salaries and high general fund tax rates
High scholastic ability test scores	Low percentages of minority group pupils and low rates of family poverty
High expenditures for instruction per pupil	Small average class sizes, fewer pupils per teacher, and high assessed valuation per pupil
High assessed valuation per pupil	Small average class sizes, fewer pupils per teacher, lower tax rates, and fewer pupils in the district
High achievement test scores	High scholastic ability test scores, high teachers' salaries, many pupils in the district, high expenditures, high proportions of nonteaching certificated personnel, low percentages of minority group pupils, low rates of family poverty, low rates of pupil mobility, low rates of staff turnover, small average class sizes, and few pupils per teacher

Results of Multiple Regression Analyses of Factors Examined in Study of California's State Testing Program

The analyses described in this section had the dual goals of (1) further mapping out the relationships between the predictor and output variables; and (2) providing sets of statistically "expected" scores for use by school districts to help them evaluate the quality of their instructional programs. Multiple regression techniques were used to develop equations for the prediction of district median achievement scores on the basis of the 18 district characteristics. For this purpose districts were divided into three types: unified, elementary, and high school districts.

District median test scores and other factors were first converted to statewide percentile ranks and then to normalized Z scores. These Z scores indicate the number of standard deviations above or below the mean each percentile rank would correspond to in a normal distribution. The Z scores were used to calculate a correlation matrix for each type of district. When data were missing, the available data were used to estimate the corresponding correlation coefficients. This procedure yielded results which must be considered to be approximations, since it assumes that the missing data do not differ from the available data. The missing information generally represented data from less than 3 percent of the districts.

For each of the three district types, the 18 district characteristics were used to develop prediction equations for predicting the 11 achievement test score variables. In developing the equations for predicting the median months of progress in reading for pupils in grades two and three, an additional variable was added: the median grade equivalent score the pupils earned at the end of grade one (variables 12 and 14).

There is no generally accepted procedure for selecting predictor variables to be included in a multiple regression equation. Draper and Smith (1966) have discussed a variety of alternatives. In this report the multiple regression equations were developed by a stepwise procedure (Efroymson, 1962) in which variables were included in a prediction equation in the order of their contribution to the prediction of a particular criterion variable. Considering predictor variables in the obtained order, those which accounted for more than an additional 1 percent of the variance in the variable being predicted were selected for inclusion in the regression equation. Multivariate procedures were also used to

te procedures were also used to

analyze these data. The results of the analyses were so similar to the findings from the multiple regression analyses in terms of the variables contributing to the prediction of each test score criterion that it was deemed to be superfluous to state them in this report.

Since the predictor variables are in approximately standard form (they were standardized across the total sample, though regression equations were developed separately for each of the types of districts), the absolute value of each regression weight reflects the contribution of a given predictor to the predictions of a criterion variable. This relationship is complex, however, due to the intercorrelation among predictor variables. These regression weights are located in the appendix.

Table 17 provides a summary of the multiple correlations obtained. All multiple correlations were statistically significant at the .001 level of confidence.

The smallest observed F value was 31.8 with 3 and 719 degrees of freedom. The multiple coefficients of determination (R^2) indicate the proportions of variance in the scores predicted accounted for by the predictions. They range from .12 to .82, with a median of .53. This indicates that about half of the variance among districts' scores is being predicted successfully. Proportions of variance are useful in assessing the contribution of particular measures to the predictions, but it should be kept in mind that they are to some extent a reflection of the particular equations used (and therefore of the methods of selecting those equations) and also of the intercorrelations among the predictors used.

Prediction of the Achievement Test Scores

The standard beta weights used in the equations for predicting the median scores for each grade level are shown in tables 1, 2, and 3 in Appendix B. These were used as in the following example: to predict first grade reading scores for the unified districts, the predicted score is .06 plus .54 times the standard score of grade six scholastic ability. This predicted score correlates .56 with the obtained scores, indicating that about .31 of the variance in the observed scores is being predicted.

The proportion of variance in the achievement scores accounted for by each predictor variable was also calculated. The interpretation of these proportions must be limited to the predictor equations used as they are influenced by the predictors used. They do, however, give a general idea of the effectiveness of each predictor variable. Tables 18, 19, and 20 present the proportions of variance each predictor accounts for in each achievement test criterion for the unified, elementary, and high school districts, respectively.

By examining Table 18 for the unified districts, it can be seen that grade six scores are the most predictable with what appears to be an increasing predictability from grade one through grade six. Scholastic ability scores for grade six account for the prediction of the greatest share of the variance in all scores in grades one through six. Grade twelve scholastic ability scores perform the same function for grade twelve achievement scores. Index of family poverty is a consistent predictor in the elementary grades but not at the secondary level. Pupil mobility has some importance in the lower grades as does percentage of minority enrollment at the high school level. Other predictor variables which appeared at least once were: pupil-teacher ratio, median teacher salary, rate of staff turnover, and average daily attendance.

In contrast to the unified districts, the indices presented on Table 19 for the elementary districts were consistently lower. The primary grades were again the most difficult to predict, and the scholastic ability scores for grade six were less useful here than for the unified districts. The grade six pattern is very similar to that for the unified except that index of family poverty appears to play a weaker role.

For the high school districts, as shown on Table 20, the total variance predicted is slightly greater than for the unified districts. Scholastic ability accounts for about the same proportions, but additional predictors enter the equation to enhance mildly the prediction; e.g., pupil mobility, rate of staff turnover, and proportion nonteaching certificated personnel.

Prediction of Months of Progress Scores in Reading

Table 21 presents the proportions of variance accounted for by each predictor in predicting median reading gains for grades two and three. The gains are more predictable for unified than for elementary districts. Of the two best predictors, grade six scholastic ability scores are usually more effective than the baseline scores – the median grade equivalent scores earned at the end of grade one. Others which appeared at least once are substantially the same as the achievement test score predictors: pupil mobility, rate of staff turnover, minimum and median teacher salaries, index of family po
minority enrollment.

Cross Validation of Regression Equations

Correlations between observed scores and predicted scores obtained by multiple regression tend to be inflated because they take advantage of chance variations among the observations. All regression equations should be validated on a second (or further) sample of data. For the present data, an effort was made to estimate the stability of the predictions by cross validation between two randomly selected halves of the present sample. Regression equations for prediction of the 11 achievement variables were calculated on each half of the districts, and these equations were used to predict the corresponding measures in the other half of the districts. In general, the prediction equations were similar to those for the entire set of data. The cross-validation correlations ranged from .32 to .80, with a median of .74. These compare favorably with the correlations for the total sample of .34 to .91, with a median of .73. This indicates that the expected shrinkage in the effectiveness of the prediction equations may be expected to be relatively slight.

Discussion and Summary

Any inferences drawn from this analysis must be tentative for several reasons, which are discussed in the next three paragraphs.

Correlation does not imply causality. This section and the previous section on correlation analyses have merely demonstrated which variables "go together." On the basis of these correlations, it is not necessarily any more valid to say, for example, that a high degree of family poverty causes low achievement than to say that weight causes height in humans simply because these two variables tend to be positively correlated. The relationship between index of family poverty and academic achievement could be interpreted as (1) poverty causes low achievement; or (2) low achievement causes poverty; or, more likely, (3) both of these variables are related to a third variable or set of variables in such a way that movement in that other variable is accompanied by corresponding movement in the index of family poverty and pupil achievement. We cannot simply predict the change that would result in one variable by manipulating a correlated variable. The feasibility of increasing achievement scores for low-scoring districts by manipulating any of the variables which are either positively or negatively related to achievement may not be any greater than that of increasing human height by adding to one's weight. However, the ability to predict achievement scores from district characteristics does provide useful information for those who wish to examine these relationships in more detail.

The predictor variables are so highly intercorrelated that it is not possible to determine the unique contribution made by each predictor. The proportion of variance contributed by each predictor in this section is limited to the context of this study. If some variables had been omitted or if other variables had been added, the regression weights and the proportions of variance explained by each predictor could have differed considerably. As
the list of predictors included in fut

so highly intercorrelated that it is unique contribution made by each f variance contributed by each ted to the context of this study. If ted or if other variables had been and the proportions of variance ould have differed considerably. As the list of predictors included in future studies is refined and expanded, these relationships may change; however, it is reasonable to expect some consistency among the outcomes.

It must be remembered that the only measures of school quality included were those derived from pupil scores on standardized achievement tests. It is fitting and proper that pupil performance be a criterion for assessment of school quality. However, scores on achievement tests provide information on only a restricted segment of the range of attitudes, skills, and behavior which schools attempt to influence. There certainly are many other important and valid objectives which need to be considered in making decisions about overall school effectiveness.

Differences Between Actual Scores and Predicted Scores for Each School District

Part II of this report presented data which allowed the reader to compare the performance of a school district on both input and output factors with that of similar school districts. This part makes it possible to compare the test performance of a school district with the best estimate of what that performance "should" be, based on the characteristics of that district. The predicted scores for each school district are the results of the multiple regression analyses. Although in reality no two school districts are identical in input characteristics, this statistical technique makes it possible, in essence, to compare the performance of a district with that of a hypothetical sample of districts with identical characteristics. Because these procedures are somewhat experimental, the reader is strongly urged to read and follow the precautions discussed in the paragraphs that follow.

Plotting the Residuals Between Actual and Predicted Scores

The differences (residuals) between the actual test scores (in Z-score terms) and the expected test scores (in Z-score terms) for each school district are listed on Table 22. The predicted scores were subtracted from the observed (actual) scores. Hence, if a residual is positive, it means that the district's actual median score exceeded the expected median score established on the basis of the district's input characteristics; if negative, the district scored below the predicted level.

Since the predicted scores can be established with more confidence for some grade levels and some instructional areas than for others, the size of the residuals has no universal meaning. Three charts are provided to assist in interpreting the residuals for unified, elementary, and high school districts. Turning to the appropriate figure, the residuals for each district can be plotted by making an "X" on the line for each test variable to indicate the magnitude of that residual. The mark should be on the right side of the center line for positive residuals and
line for residuals with a negative sign.

The dark bands indicate the area in v
residuals for all predictions will fall. Becaus
statistical procedures employed, one-fourt
must fall above the dark bands, and one-fo
must fall below the bands.

Interpreting the Residuals Between Actual

In simplest terms, when residuals fall to
the district scored below what would be "e
of the resources and characteristics of the d

assist in interpreting the residuals for
gh school districts. Turning to the
als for each district can be plotted by
for each test variable to indicate the
he mark should be on the right side
of the center line for positive residuals and on the left side of the line for residuals with a negative sign.

The dark bands indicate the area in which one-half of the residuals for all predictions will fall. Because of the nature of the statistical procedures employed, one-fourth of the predictions must fall above the dark bands, and one-fourth of the predictions must fall below the bands.

Interpreting the Residuals Between Actual and Predicted Scores

In simplest terms, when residuals fall to the left of the bands, the district scored below what would be “expected” on the basis of the resources and characteristics of the districts. When residuals fall within the darkened areas, the district scored about as expected. When residuals fall to the right of the bands, the districts scored better than expected. Several important considerations in interpreting the residuals are presented here:

1. Because these predictions are not precise, one is not justified in making any discriminations finer than that of “below expectancy,” “within the range of normal expectancy,” and “above expectancy.”
2. Since any single discrepancy may not have much meaning, one should look for trends; i.e., Where are most of the residuals? Which particular grade levels are above or below predictions? In terms of residuals, which curricular areas are highest and which are lowest?
3. The problem of inaccuracy of the residuals is especially great for small school districts. The actual median scores for these districts are based on a small number of pupils at each grade level and are likely to fluctuate from year to year and from grade level to grade level. Any interpretations formed for such districts must be held as extremely tentative.

4. The predicted or expected score is not an absolute standard or criterion. By virtue of the statistical technique used, one-half of all residuals will be below the center line, and one-half will be above the line. To conclude that California schools are failing because one-half of all districts score below expectancy would be to miss the point. The residuals do not demonstrate, in any absolute sense, how well or how poorly any school district is doing. They do indicate, however, in a relative sense, how each district is doing in comparison with other districts with similar financial, social, and educational characteristics.
5. A major aim of this report is to help school districts identify areas of strength and weakness within their instructional programs. However, before concluding that the instructional program is to be blamed for negative residuals or to be credited with positive residuals, one should be sure the predictions were not distorted due to some unique situation or set of circumstances within the district which may not be properly reflected or accounted for in the prediction equations. The socioeconomic composition of the community may be changing faster than it is being reflected in the predictors. For example, a large and immediate migration of persons of a lower economic level might depress the average scores without necessarily depressing the predictors at the same rate. Since much of the predicting is based on pupil ability scores, the attitudes of the school personnel and the pupils toward the test are important. These attitudes, if negative, could adversely affect ability test performance, which would lead to low predictions and hence to inflated positive residuals. Special characteristics of the pupils, such as different language backgrounds, have not been entered into the prediction equations. Other important factors, such as attitudes of parents toward the schools and relationships between pupils and teachers, have not been considered but may be influential factors in determining pupil achievement.
   For other districts the goa

These attitudes, if rsely affect ability test performance, low predictions and hence to inflated cial characteristics of the pupils, such as ckgrounds, have not been entered into ions. Other important factors, such as toward the schools and relationships eachers, have not been considered but ctors in determining pupil achievement.

For other districts the goals of instruction may be sufficiently different from the content of the tests to warrant special interpretation of the results.

6. All test scores and predictions pertain only to the test results from the 1969-70 school year. These results should be considered as one sampling of results which should be considered in the light of other samplings in future years.
7. The main concern being emphasized by each of these points is that since these initial predictions are less than precise, all conclusions must be tentative, suggestive, and exploratory in nature.

In the light of these precautions, the results of the multiple regression analyses can be summarized as follows:

- The best predictor for all grade levels was scholastic ability. The logic of this finding was explained in the section on correlation analyses.
- Because of its strong inverse relationship to pupil achievement, index of family poverty was usually the second best predictor of pupil achievement.
- Other variables of lesser predictive power were: pupil mobility, percentage of minority enrollment, teachers' salaries, rate of staff turnover, size of district, pupil-teacher ratio, and proportion of nonteaching certificated employees.
- Scores for unified districts can be predicted more accurately than those for elementary districts. Undoubtedly one reason for this finding is the fact that since many of the elementary districts have very few pupils at each grade level, the medians are based on a small number of pupils. These medians are less reliable and therefore are more difficult to predict.
- Scores for the primary grades are the least predictable; those for the upper elementary grades were predicted the most accurately. This finding may be, in part, a function of the variables available for inclusion in the equation for each of the grade levels.

APPENDIX B

TABLE B-1

Standard Score Regression Weights for Predicting Median Achievement Test Scores from 16 School District Characteristics*

Elementary School Districts

Predictor Variable	Standard score regression weights, by grade and test						
	1	2	3	6			
	Reading			Reading	Language	Spelling	Mathematics
Constant	.00	.04	.00	.00	.00	.01	.01
Minimum Teacher Salary							
Maximum Teacher Salary							
Median Teacher Salary							
Average Class Size 1-3							
Pupil-Teacher Ratio 4-8							
Non-Teaching Personnel							
General Fund Tax Rate							
General Purpose Tax Rate							
Assessed Valuation/ADA							
Minority Enrollment			-.13	-.13			
Index of Family Poverty	-.16	-.20	-.17				-.18
Scholastic Ability Grade 6	.20	.25	.32	.77	.80	.70	.57
Pupil Mobility Grades 1-8		-.14					-.11
Rate of Staff Turnover	-.13		-.13				
Expenditures per ADA							
Regular ADA Grades 1-12		.13				.15	

* Regression weights are listed for all variables whose inclusion in the regression equation decreased the amount of unexplained variance by at least one percent.

APPENDIX B – *Continued*

TABLE B-2

Standard Score Regression Weights for Predicting Median Achievement Test Scores from 18 School District Characteristics*

Unified School Districts

Predictor Variable	Standard score regression weights, by g							
	1	2	3	6				
	Reading			Read-ing	Lan-guage	Spelling	Mathe-matics	Re in
Constant	.06	-.03	.06	.01	-.01	.09	-.01	.
Minimum Teacher Salary								
Maximum Teacher Salary								
Median Teacher Salary								
Average Class Size 1-3								
Pupil-Teacher Ratio 4-8			-.11					
Non-Teaching Personnel								
General Fund Tax Rate								
General Purpose Tax Rate								
Assessed Valuation/ADA								
Minority Enrollment								
Index of Family Poverty		-.13	-.15	-.16	-.20	-.12	-.15	-.
Scholastic Ability Grade 6	.54	.39	.41	.74	.68	.67	.60	
Scholastic Ability Grade 12		.12	.12				.13	.
Pupil Mobility Grades 1-8		-.15	-.11					
Pupil Mobility Grades 9-12								
Rate of Staff Turnover		-.12						
Expenditures per ADA								
Regular ADA Grades 1-12								

* Regression weights are listed for all variables whose inclusion in the regression equati unexplained variance by at least one percent.

TABLE B-2

Standard Score Regression Weights for Predicting Median Achievement Test Scores from 18 School District Characteristics*

Unified School Districts

Standard score regression weights, by grade and test										
1	2	3	6				12			
Reading			Reading	Language	Spelling	Mathematics	Reading	Language	Spelling	Mathematics
.06	-.03	.06	.01	-.01	.09	-.01	.02	-.08	-.28	-.08
								.20		.19
		-.11								
							-.19			-.18
	-.13	-.15	-.16	-.20	-.12	-.15

	.12	.12				.13	.67	.66	.58	.58
	-.15	-.11								
	-.12									
									.30	

isted for all variables whose inclusion in the regression equation decreased the amount of at least one percent.

APPENDIX B – *Continued*

TABLE B-3

Standard Score Regression Weights for Predicting Median Achievement Test Scores from 14 School District Characteristics*

High School Districts

Predictor Variable	Standard score regression weights for grade twelve, by test			
	Reading	Language	Spelling	Mathematics
Constant	-.04	-.26	.03	-.12
Minimum Teacher Salary		-.14		
Maximum Teacher Salary				
Median Teacher Salary		.20	.14	
Non-Teaching Personnel			-.22	
General Fund Tax Rate				
General Purpose Tax Rate				
Assessed Valuation/ADA				
Minority Enrollment	-.15			-.20
Index of Family Poverty				
Scholastic Ability Grade 12	.63	.58	.50	.66
Pupil Mobility Grades 9-12		-.13		
Rate of Staff Turnover				-.14
Expenditures per ADA				
Regular ADA Grades 1-12		.16	.33	

* Regression weights are listed for all variables whose inclusion in the regression equation decreased the amount of unexplained variance by at least one percent.

APPENDIX B – *Concluded*

TABLE B-4

Summary of Regression Weights for Predicting Months of Progress in Reading for Grades Two and Three*

Predictor Variable	Grade 1 to Grade 2 Gain		Grade 1 to Grade 3 Gain	
	Unified	Elementary	Unified	Elementary
Constant	-.13	.03	-.04	.03
Minimum Teacher Salary		.10		
Maximum Teacher Salary				
Median Teacher Salary				.11
Average Class Size 1-3				
Pupil-Teacher Ratio 4-8				
Non-Teaching Personnel				
General Fund Tax Rate				
General Purpose Tax Rate				
Assessed Valuation/ADA				
Minority Enrollment				-.15
Index of Family Poverty		-.12		-.11
Scholastic Ability Grade 6	.23	.11	.62	.23
Scholastic Ability Grade 12	.14			
Pupil Mobility Grades 1-8	-.14			
Pupil Mobility Grades 9-12				
Rate of Staff Turnover	-.10		-.10	
Expenditures per ADA				
Regular ADA Grades 1-12				
Grade 1 Base - GE	.16	.24		

*Regression weights are listed for all variables whose inclusion in the regression equation decreased the amount of unexplained variance by at least one percent.
